

Vasundhara Hospital, Ghaziabad

Alzheimer's Disease Medical Report

Patient Details:

Name:	Rajesh K. Verma
Age/Gender:	72 years / Male
Report Date:	14 / 09 / 2026

Consulting Physician:

Dr. A. K. Banerjee, MD (DM Neurology)

Specialization: Neurology

Hospital: Vasundhara Hospital, Ghaziabad

Medical History:

- Memory decline since 14 months (worsening episodic memory loss reported by spouse).
- Frequently forgets objects, names, dates, or directions in familiar neighborhood.
- Behavioral changes and difficulty in decision making / managing household finances.
- Sleep disturbances and mood changes observed (evening anxiety, restless sleep).

Physical & Cognitive Examination:

- Blood Pressure: 132/84 mmHg
- Pulse: 74 per minute
- Cognitive Test (MMSE Score): **19 / 30** (Decline from previous score of 24/30)
 - Orientation: 5 / 10 (disoriented to date and month)
 - Memory: 2 / 6 (impaired 3-word delayed recall)
 - Attention: 3 / 5 (difficulty with serial 7s)
 - Language: 9 / 9 (naming and comprehension intact)

Lab & Imaging Reports:

- **MRI Brain:** Hippocampal atrophy / cortical sulci widening (MTA Score: Grade 2 bilateral hippocampal volume reduction)
- **Blood Tests:** Thyroid profile (TSH: 2.1 mIU/L - Normal), Vitamin B12 (420 pg/mL - Normal), Blood sugar (HbA1c: 5.7% - Normal)
- **EEG:** Mild slowing of theta wave activity in bilateral fronto-temporal regions; no epileptiform discharges

Diagnosis:

Alzheimer's Disease (Moderate stage) — Progressive neurodegenerative course with longitudinal cognitive decline.

Treatment Plan:

1. **Medications:** Donepezil 10mg once daily (OD) post dinner; Memantine 10mg twice daily (BD) with titration.
2. **Lifestyle & Family Support:** Regular cognitive exercises, structured visual routines, balanced Mediterranean diet, light daily physical exercise, active family supervision.
3. **Follow-up:** Every 3–6 months with neurologist for monitoring of cognitive trajectory and treatment response.

Conclusion:

Patient has been diagnosed with Alzheimer's Disease. It is a progressive condition, but with proper treatment, cognitive rehabilitation, and compassionate care, progression can be slowed, and quality of life can be improved.
