

Vasundhara Hospital, Ghaziabad

Alzheimer's Disease Medical Report

Patient Details:

Name:	Rajesh K. Verma
Age/Gender:	73 years / Male
Report Date:	18 / 03 / 2027

Consulting Physician:

Dr. A. K. Banerjee, MD (DM Neurology)

Specialization: Neurology

Hospital: Vasundhara Hospital, Ghaziabad

Medical History:

- Memory decline since 20 months (marked rapid clinical deterioration over the last 6 months).
- Frequently forgets close family members' names, confuses grandchildren, and got lost in home backyard.
- Pronounced behavioral changes, severe apathy, wandering attempts toward outside street, and difficulty dressing.
- Significant evening agitation (sundowning) and severe sleep cycle inversion.

Physical & Cognitive Examination:

- Blood Pressure: 138/86 mmHg
- Pulse: 78 per minute
- Cognitive Test (MMSE Score): **13 / 30** (Significant decline from previous score of 19/30 on 14/09/2026; lost 6 points in 6 months)
 - Orientation: 2 / 10 (disoriented to date, year, and hospital location)
 - Memory: 0 / 6 (0/3 word recall at 3 minutes; profound delayed recall deficit)
 - Attention: 2 / 5 (unable to complete serial subtractions)
 - Language: 6 / 9 (significant word-finding pauses, simplified speech, naming difficulty)

Lab & Imaging Reports:

- **MRI Brain:** Severe bilateral hippocampal atrophy (MTA Score: Grade 3/4 progression), significant ventricular enlargement, widening of Sylvian fissures and diffuse cortical volume reduction.
- **Blood Tests:** Thyroid profile (TSH: 2.3 mIU/L - Normal), Vitamin B12 (390 pg/mL - Normal), Blood sugar (HbA1c: 5.9% - Normal)
- **EEG:** Moderate generalized slowing with theta/delta wave predominance across bilateral temporal and parietal regions.

Diagnosis:

Alzheimer's Disease (Moderate-to-Advanced / Severe stage) — Accelerated neurodegenerative decline with severe episodic memory impairment and functional dependency.

Treatment Plan:

1. **Medications:** Donepezil 10mg OD continued; Memantine titrated up to 20mg daily (10mg BD). Consider low-dose Quetiapine 12.5mg for evening agitation/sundowning if distress persists.
2. **Lifestyle & Family Support:** Full-time 24/7 caregiver assistance for eating, bathing, and dressing. Install door exit chime alarms and GPS wearable locator to prevent wandering accidents.
3. **Follow-up:** Close neurological monitoring every 2–3 months for behavioral and functional status check.

Conclusion:

Patient exhibits advanced cognitive and functional progression of Alzheimer's Disease. Patient is no longer safe to remain unsupervised at home. Intensive caregiver support, home safety modifications, and memory-assistive protocols are urgently required.
